1. INTRODUCTION

A prospective, double-blind, randomised, controlled, parallel group, multicentre and multinational trial was carried out to assess the activity and tolerability of reboxetine in comparison with placebo and fluoxetine in patients suffering from Major Depressive Episodes (DSM-III-R classification). Patients of either sex, of any race, aged 18 to 65 years, with a diagnosis of Major Depressive Episode, not accompanied by psychotic features (DSM-III-R) with the current episode present for 1-4 months and with a pre-treatment total score for the 21-item Hamilton Depression Rating Scale (HAMD) ≥ 22 , could participate in the study.

Three hundred and eighty-one patients from 33 centres were randomised to treatment with either reboxetine (126), fluoxetine (127) or placebo (128). Following an initial wash-out period of 4-14 days (≥ 3 weeks in case of fluoxetine administration), patients received reboxetine 4 mg b.i.d., fluoxetine 20 mg o.a.d. or placebo for eight weeks. At the end of the 4th Week of treatment the dose could be increased to 10 mg/day reboxetine or 40 mg/day fluoxetine up to the end of the study.

Safety and tolerability were assessed by the reporting of adverse events and assessment of vital signs (supine and standing blood pressure and heart rate), laboratory tests, and ECG. Efficacy was weekly assessed by using the HAMD Scale, the Clinical Global Impression Scale (CGI), the Montgomery and Asberg Depression Rating Scale rated by the investigators and by using the patient Global Impression Scale (GIS), the Social Adaptation Self-evaluation Scale (SASS) and the Quality of Sleep Evaluation Questionnaire filled in by the patient. The statistical analysis was focused on the rating scales total scores (change of HAMD total score vs baseline being the study end-point) and on the frequency of response, defined as at least 50% decrease compared to the baseline value of HAMD total score, and of remission, defined as a total HAMD score of 10 or less.

Safety and tolerability results as well as efficacy results coming from the investigator assessments are reported in report no. 9550080. Patient self-assessment results are reported separately in this Addendum.

2. DESCRIPTION OF THE PATIENT SELF-EVALUATION INSTRUMENT

The instrument includes 3 different scales/questionnaires: the GIS, the Quality of Sleep Evaluation Questionnaire and the SASS. The following paragraphs describe the scales and how information was collected. A patient's self-assessment booklet was prepared. Translations into local languages (English, French, Italian, Portuguese, and Polish) were used. Patient's self-assessment was performed at baseline and then at weekly intervals, for all assessments except GIS, which was performed for the first time at Day 7.

2.1 Global Impression Scale

The patient global impression score was collected on a ten levels visual-analogue scale. At each assessment interval the patient was requested to choose a level between 0 and 10 corresponding to his/her degree of global improvement with respect to his/her conditions at entry into the study. A score lower than 5 indicates that the patient's condition worsened, and

Pharmacia

Document 9550081

a score above 5 indicates that his/her condition improved. A score of 5 corresponds to a global condition unchanged.

The GIS score, corresponding to the patient's global assessment of change vs baseline, was assessed at weekly intervals, from Day 7 on.

2.2 Quality of Sleep

The quality of sleep was assessed by a five items multiple choice questionnaire. The items are analysed separately, since a total score would be meaningless. Each question was answered with a score from 1 (best score) to 4 (worst score). The items concern:

- Time to fall asleep (Immediately, After 15-30 min., After one hour or more, No sleep at all).
- Presence of dreams (Not at all, A little bit, Moderately, All the night).
- Awakenings during the night (No times, 1-2 times for a short period, 1-2 times for a long period, 3 times or more).
- Quality of rest the morning after (Fully rested, Quite rested, A little bit tired, Tired and fatigued).
- Quality of sleep (Very good, Good, Fair, Poor).

In addition, in the same CRF form, patients were requested to indicate the time of falling asleep and of waking up (hour and minute).

2.3 Social Adaptation Self-evaluation Scale

This third part of the self evaluation instrument has been devised to assess the level of social adaptation of the patients. It includes 20 items, each with 4 levels of choice, from 0 (worst) to 3 (best). Results of the scale validation will be reported elsewhere [Internal Report, in preparation]. The 20 items allow collection of information on many different components of social adjustment:

- Interest in occupation or home related activities.
- Quality of activities.
- Interest in hobbies/leisures.
- Quality of spare time.
- Interest in family relationships.
- Quality of family relationships.
- Quantity of extra-family relationships.

Pharmacia

Document 9550081

- Interest in extra-family relationships.
- Quality of extra-family relationships.
- Value attached to extra-family relationships.
- Interdependence patient-social circle.
- Compliance with social rules.
- Quest for community activities.
- Inquiry/Learning.
- Interest in cultural matters.
- Difficulty in communicating.
- Feeling of exclusion.
- Interest in personal physical appearance.
- Management of resources.
- Organisation of environment.

The information has been analysed item by item as well as globally, computing a total SASS score.

3. STATISTICAL ANALYSIS

The analysis was intended as an exploratory analysis on secondary efficacy assessments.

Scores and indexes were submitted to ANOVA, to test the between treatments differences of average values over time and at last assessment. In case of significant F test, a pairwise t test was used, to test the differences between each pair of treatments (least significant difference and Bonferroni test). Categorical data were submitted to Chi-Square test of the differences between frequencies in the three treatment groups. Indexes of improvement between assessments were calculated in order to avoid the problem of dependent samples and to take into consideration possible differences between patients at baseline, defined as [5]:

(Total score at last assessment - Total score at baseline) / Total score at baseline.

4. RESULTS

4.1 Patients Population

Three hundred eighty one patients were involved in the study. Only 354 patients provided information on self-assessment. In addition, for 21 patients only baseline information was provided.

In summary, not evaluable patients included:

Not evaluable patients	Fluoxetine	Placebo	Reboxetine
No information provided	11	11	5
Day 0 only *	5	6	10

* index of improvement not evaluable

Some patients did not complete all the scales/questionnaire of the self-assessment instrument at every visit: therefore the number of patients included in the analysis varies between assessments. However, all the information collected was analysed.

4.2 Global Impression Scale

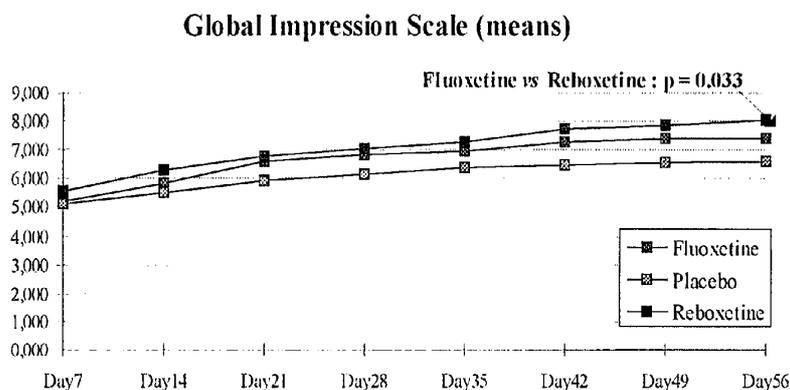

4.2.1 WEEKLY ANALYSIS OF OBSERVED CASES

The number of patients included in the analysis is given below.

Treatment	D7	D14	D21	D28	D35	D42	D49	D56	Remission
Fluoxetine	89	86	81	82	77	72	72	68	39
Placebo	91	86	80	78	71	66	60	60	22
Reboxetine	88	84	81	76	74	66	65	65	45
Total	268	256	242	236	222	205	197	193	105

Two hundred seventy four patients provided at least one GIS evaluation.

The average values of the GIS Scale in the three treatment groups at the weekly assessments are given in Table 1 and Appendix 1, and depicted hereafter.

Up to Day 14, the degree of improvement is similar in the three groups, with no significant difference between them.

From Day 21 to Day 42, the active treatment groups are significantly different from placebo, while there is no significant difference between fluoxetine and reboxetine.

From Day 49, the improvement in the reboxetine group appears superior to the fluoxetine group, but that difference reaches statistical significance only at Day 56.

The rate of improvement is maximal at Day 35 on placebo, at Day 42 on fluoxetine, and at Day 56 on reboxetine.

4.2.2 LAST VALID OBSERVATION

The frequency distribution of GIS scores at last assessment is given by treatment group in Table 2 of Appendix 1. The difference between the three groups is statistically significant ($p=0.005$, Chi-Square test).

Mean values of the GIS scores at last assessment are given in Table 3 of Appendix 1. Again the difference between both active drugs and placebo is statistically significant ($p < 0.05$), while the difference between reboxetine and fluoxetine average values is not significant. However, the median value in the reboxetine group is 1 point higher than in the fluoxetine and 2 points higher than in the placebo group. The 25% to 75% percentiles of the median scores are smaller in the reboxetine group, compared to the fluoxetine and placebo groups, and do not include scores indicating unchanged or deteriorated global condition (5 or less). In fact, as shown in Table 2, 79.3% of the patients of the reboxetine group have a final score of at least 6, i.e. corresponding to an improved global condition, compared to 70.7% of the patients of the fluoxetine group and to 56.4% only of the placebo group.

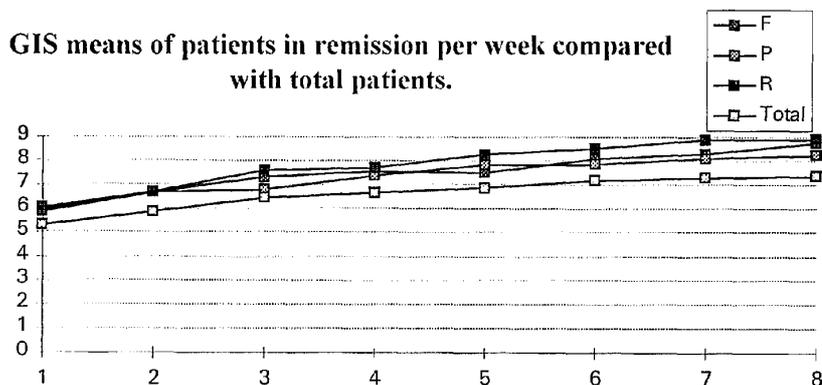

4.2.3 PATIENTS IN REMISSION

Forty five, 39 and 22 of the 274 analysed patients were in remission at the end of treatment in the reboxetine, fluoxetine and placebo group, respectively. As shown below, in all treatment

groups on Day 7 the average GIS value is 6, indicating a perception of quick improvement on the average in this sub-population. On Day 14 the three treatment groups have a superimposable mean perception of improvement, while from the third Week on, the pattern of the mean GIS values becomes more variable, with no important differences between the three treatment groups.

Mean values by treatment

Treatment	Day 7	Day 14	Day 21	Day 28	Day 35	Day 42	Day 49	Day 56
Fluoxetine	5.86	6.69	7.31	7.54	7.49	8.09	8.31	8.76
Placebo	5.94	6.68	6.78	7.37	7.82	7.84	8.11	8.24
Reboxetine	6.05	6.71	7.58	7.70	8.26	8.53	8.89	8.92

Considering the difference between the sub-populations eventually in remission in the three groups and the total population, it appears that the sub-population eventually in remission with placebo and the total patient sample have a perception of improvement rate very similar: the placebo-treated sub-population eventually in remission seems to have a better initial condition, but does not seem to recover faster than the global mean trend. The mean perception of improvement in the two active drug groups is only marginally higher, up to the final assessment.

4.3 Quality of Sleep

4.3.1 SLEEPING TIME

The use of chloral hydrate (CH) at a dose of 500-1000 mg at night on p.r.n. basis was allowed according to the protocol. In order to evaluate the possible differences between groups according to use of CH more accurately, only patients for whom both Day 0 and Day 56 assessments of sleep duration were available have been analysed. Among these patients, 16 patients of the reboxetine, 10 patients of the fluoxetine and 9 patients of the placebo group

Pharmacia

Document 9550081

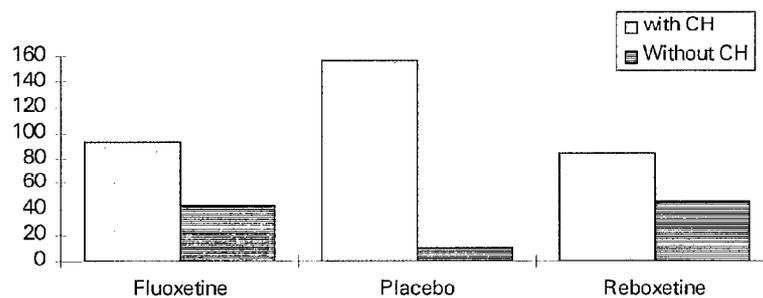

received CH at least once during the study period, while 43, 50 and 44 patients, respectively, did not.

The average improvement in sleeping time (in minutes) on reboxetine, fluoxetine and placebo in patients receiving CH and in patients not receiving CH is shown below.

Mean increase of sleep duration in minutes

Group	Reboxetine	Fluoxetine	Placebo
With CH	84.4	92.5	157.2
Without CH	45.8	42.7	10.7
Total	56.0	51.0	34.0

Difference of sleeping time between D0 and D56

The effect of both active drugs on sleeping time is very clear. The effect of CH is more evident in the placebo group than in the active treatment groups, the improvement of sleeping time when CH is added to placebo being more important and statistically significant ($p = 0.032$).

In the reboxetine and fluoxetine groups, the addition of CH treatment is associated with an improvement of sleeping time twice as important as no addition, but the difference is not statistically significant.

Considering the total population, at the end of the study the patients on placebo show a non significant average increase of sleep duration of 34 minutes, compared to 51 minutes for the fluoxetine group and to 56 minutes for the reboxetine group.

4.3.2 QUALITY OF SLEEP: WEEKLY ANALYSIS OF OBSERVED CASES

The frequencies of the scores of the five questionnaire items at weekly assessment intervals are given in Table 5 by treatment, together with the significant p values of the Chi-Square test, and the means of scores in Table 4 of Appendix 2. Percent frequencies of patients by couple (1 and 2, 3 and 4) of item score at baseline, as well as at Weeks 4 and 8 are shown hereafter.

Item : Time to fall asleep (% frequency of patients).

Week	0		4		8	
	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>
F	45.2	54.8	70.7	29.3	76.1	23.9
P	30.9	69.1	52.6	51.6	60.3	39.7
R	39.0	61.0	71.0	29.0	81.5	18.5

A clear-cut improvement of the time to fall asleep is present in the three groups at the Week 4 evaluation, with small improvement thereafter. The distribution of the frequencies in the active drugs groups is somewhat different from the placebo group in view of the higher frequency of patients scored 1 (immediate fall asleep) or 2 (after 15-30 minutes) and the lower frequency of patients scored 3 (after 1 hour or more) at Weeks 4 and 8 compared to baseline. Differences, however, do reach statistical significance at Weeks 5 and 6 only.

Item : Presence of dreams (% frequency of patients).

Week	0		4		8	
	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>
F	64.3	35.7	59.8	40.2	71.6	28.4
P	47.6	52.4	71.8	28.2	67.2	32.8
R	62.2	37.8	80.3	19.7	87.7	12.3

The distribution of the frequencies is similar over time in the placebo and fluoxetine groups, with a small improvement for placebo at Week 4 that disappears at Week 8. Presence of dreams is clearly lower in the reboxetine group, between treatment difference reaching statistical significance from Week 4 to 8.

Item : Awakenings during the night (% frequency of patients).

Week	0		4		8	
	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>
F	39.3	60.7	68.4	31.6	77.6	22.4
P	28.6	71.4	52.1	47.9	60.3	39.7
R	41.5	58.5	77.0	23.0	87.7	12.3

Pharmacia

Document 9550081

From Week 4 to Week 8 some differences between the three groups can be noticed:

- in the reboxetine group, the large majority of the patients scored their sleep either 1 (no awakenings, 44%) or 2 (1-2 short awakenings, 43%).
- in the fluoxetine group, patients answers were mainly 2 (55%), or 1 (22%).
- in the placebo group, the majority of the patients scored their sleep either 2 (48%) or 3 (1-2 long awakenings, 32%).

A general improvement in the number of awakenings is present from Week 0 to Week 4, with some differences between the three groups that reach a significant level since Week 5.

Item : Quality of rest the morning after (% frequency of patients).

Week	0		4		8	
score	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>
F	21.4	78.6	50.6	49.4	56.7	43.3
P	20.2	79.8	38.5	61.5	50.0	50.0
R	29.3	70.7	63.2	36.8	80.0	20.0

At Week 0 no difference between the three groups is apparent. At Week 4, the distribution of the frequencies indicates an improvement in all the three groups, somewhat more marked in the reboxetine group. At Week 8, some other differences between the three groups are apparent:

- 80 % of patients in the reboxetine group feel fully or quite rested in the morning (score 1 or 2), compared to 57 % in the fluoxetine group and to 50 % in the placebo group.
- About 30% of patients in both placebo and fluoxetine groups feel a little bit tired in the morning (score 3) vs 12% in the reboxetine group.

The Chi-Square test indicates a significant difference between treatments at Weeks 3 and 5 to 8.

Item : Quality of sleep (% frequency of patients).

Week	0		4		8	
score	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>	<i>best</i>	<i>worst</i>
F	19.0	81.0	47.6	52.4	58.2	41.8
P	16.7	83.3	34.6	65.4	44.8	55.2
R	19.5	80.5	57.9	42.1	73.8	26.2

At Week 0 no difference between the three groups is apparent. At Week 4, the frequency of patients scoring 3 and 4 (worst) decreases dramatically, particularly on active treatments and 58% of the patients on reboxetine judged their sleep as good or very good (score 1 or 2), compared to 48 % of the patients on fluoxetine and to 35% of those on placebo.

Pharmacia

Document 9550081

This difference is maintained at Week 8, when 74% of the patients on reboxetine rated their sleep as good or very good, compared to 58% of the patients on fluoxetine and to 45% of those on placebo.

The Chi-Square test indicates a significant difference between treatments from Week 4 to Week 8.

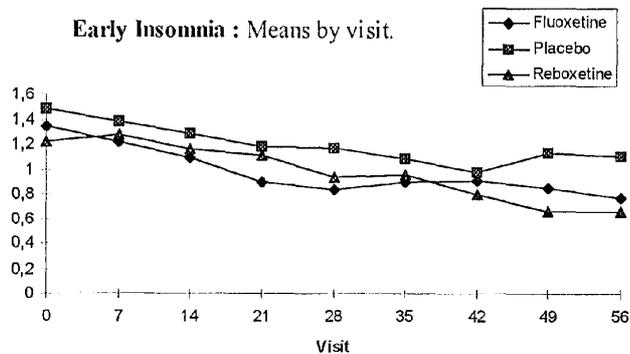

4.3.3 HAMD SLEEP-RELATED ITEMS

The HAMD sleep-related items provide information about insomnia (early, middle, late), as detailed in Appendix 2. Some of the patient groups previously commented are worth discussing. Only the patients providing information on both Quality of Sleep Evaluation Questionnaire and HAMD Scale have been selected for the analysis.

The mean values of each item at weekly intervals in the three treatment groups are shown in the following tables and figures.

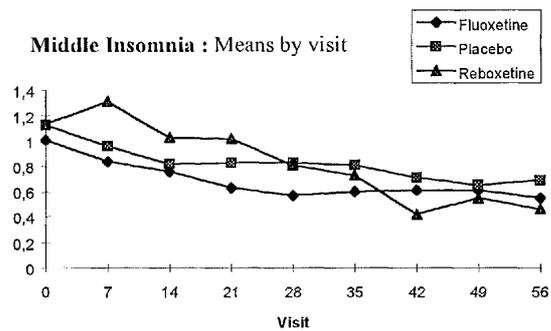

Score mean values of early insomnia

Treatment	Day 0	Day 7	Day 14	Day 21	Day 28	Day 35	Day 42	Day 49	Day 56
Fluoxetine	1.35	1.22	1.09	0.90	0.84	0.90	0.91	0.85	0.77
Placebo	1.48	1.39	1.29	1.18	1.17	1.08	0.98	1.13	1.10
Reboxetine	1.22	1.28	1.16	1.11	0.94	0.96	0.80	0.66	0.66

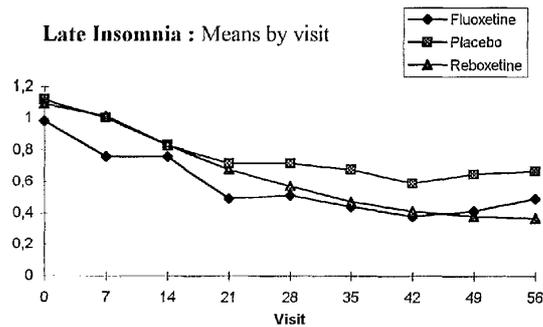

Score mean values of middle insomnia

Treatment	Day 0	Day 7	Day 14	Day 21	Day 28	Day 35	Day 42	Day 49	Day 56
Fluoxetine	1.01	0.84	0.76	0.63	0.57	0.60	0.61	0.61	0.55
Placebo	1.13	0.96	0.82	0.83	0.83	0.81	0.71	0.65	0.69
Reboxetine	1.14	1.31	1.03	1.02	0.81	0.73	0.42	0.55	0.46

Score mean values of late insomnia

Treatment	Day 0	Day 7	Day 14	Day 21	Day 28	Day 35	Day 42	Day 49	Day 56
Fluoxetine	0.98	0.76	0.76	0.49	0.51	0.44	0.38	0.41	0.49
Placebo	1.12	1.00	0.83	0.72	0.72	0.68	0.59	0.65	0.67
Reboxetine	1.09	1.01	0.83	0.68	0.57	0.47	0.41	0.38	0.37

Pharmacia

Document 9550081

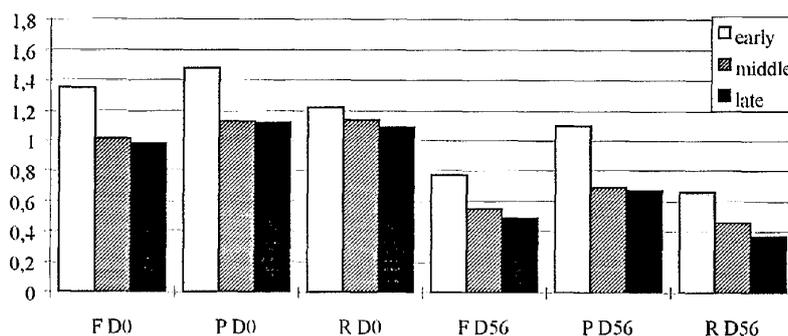

The above pattern indicate a greater improvement on active drugs compared to placebo, though the difference is not significant. As for early insomnia, which reflects depressive anxiety, as well as for late insomnia, which reflects more specifically depressed mood, in the placebo arm the results indicate maximal effect at Week 6 (Day 42), and deterioration at Weeks 7 and 8, which is the classical evolution with placebo medication.

Initially during treatment, up to Day 21-35, fluoxetine appears slightly more active than reboxetine on all sleep items. On the contrary, reboxetine appears slightly more effective at the last assessment intervals.

In fact, when comparing the mean values of the HAMD items in the three treatment groups at Day 0 and Day 56, the baseline condition is found to be similar in the three groups, early insomnia being marginally less severe in the reboxetine group, and middle and late insomnia less severe in the fluoxetine group, while the Day 56 condition is more severe in the placebo group than in the active treatment groups for all the three items and only marginally less severe in the reboxetine than in the fluoxetine group.

DAY	TREATMENT	EARLY INSOMNIA	MIDDLE INSOMNIA	LATE INSOMNIA	PATIENTS NO.
D0	Fluoxetine	1.35	1.01	0.98	92
	Reboxetine	1.22	1.14	1.09	91
	Placebo	1.48	1.13	1.12	93
D56	Fluoxetine	0.77	0.55	0.49	71
	Reboxetine	0.66	0.46	0.37	65
	Placebo	1.10	0.69	0.67	61

HAMD sleep items at D0 and D56.

Several consistencies between the findings from the HAMD insomnia items and the Quality of Sleep Evaluation Questionnaire are apparent. The effect of treatments on HAMD early

Pharmacia

Document 9550081

insomnia item seems to parallel the one on time to fall asleep item with a slight difference in favour of reboxetine, compared to fluoxetine and placebo. Similarly the improvement of the HAMD middle insomnia item has a similar pattern to the number of awakenings item. As shown below, patients in remission on placebo suffer from early rather than late insomnia:

Score mean values of insomnia items in the remission cases of placebo group

HAMD item	Day 0	Day 7	Day 14	Day 21	Day 28	Day 35	Day 42	Day 49	Day 56
Early insomnia	1.5	1.31	1.05	1.05	0.84	0.71	0.56	0.89	0.67
Middle insomnia	1.32	1.00	0.74	0.79	0.63	0.41	0.33	0.22	0.28
Late insomnia	1.05	1.00	0.74	0.58	0.53	0.24	0.11	0.28	0.17

As shown below, the group of patients who received CH was on the average slightly more severely affected at baseline than the patients who did not receive CH.

GROUP	EARLY INSOMNIA	MIDDLE INSOMNIA	LATE INSOMNIA
Fluoxetine with CH	1.46	1.18	1.25
Fluoxetine without CH	1.30	0.94	0.86
Reboxetine with CH	1.43	1.43	1.33
Reboxetine without CH	1.11	1.00	0.97
Placebo with CH	1.58	1.16	1.29
Placebo without CH	1.44	1.11	1.03

Day 0 and Day 56 results in patients taking CH and in the whole group are shown below.

DAY	TREATMENT	EARLY INSOMNIA	MIDDLE INSOMNIA	LATE INSOMNIA	PATIENTS NO.
D0	Fluoxetine+CH	1.46	1.18	1.25	28
	Reboxetine+CH	1.43	1.43	1.33	30
	Placebo+CH	1.58	1.16	1.29	31
	All patients	1.35	1.09	1.06	276
D56	Fluoxetine+CH	0.56	0.61	0.56	18
	Reboxetine+CH	0.76	0.65	0.65	17
	Placebo+CH	0.82	0.91	0.64	11
	All patients	0.84	0.56	0.51	197

Pharmacia

Document 9550081

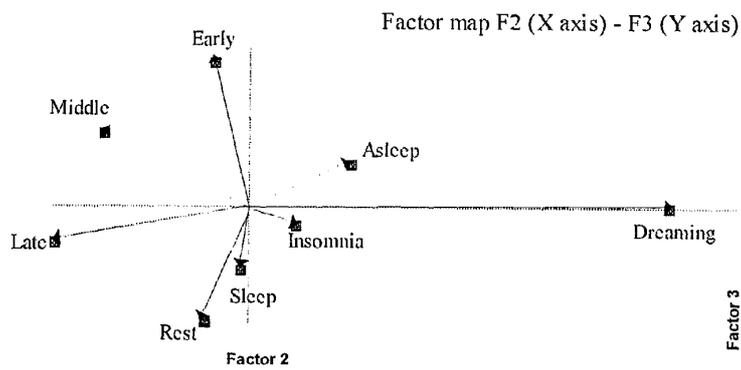

Contrary to the results of the analysis of sleep duration from the Quality of Sleep Evaluation Questionnaire, the improvement of HAMD sleep-related items is similar in the three treatment groups.

The principal component analysis (PCA) [1, 2, 9, 10], carried out on the results of the Quality of Sleep Evaluation Questionnaire and HAMD sleep-related items, indicates relative absence of concordance between the results coming from the two scales. Indeed, as shown in the Table reported below, PCA evidenced three factors. Representation of the items of the two scales for factors 2 and 3 is given in the figure reported below. The items of two scales clearly reside in different plans. This global difference between the two groups of items is the result of a structural difference linked to the principle of the analysis itself, but it shows an opposite representation of the items from the HAMD Scale and the items from the self-evaluation of sleep, meaning that the investigator's point of view about the patient condition was different from the point of view of the patient about his/her own condition (self- vs hetero-evaluation). However, PCA results show a negative correlation between HAMD late insomnia and quantity of dreams, as well as a negative correlation between early insomnia and quality of rest.

Score								
Factor	Time to fall asleep	Quantity of dream	Number of awakenings by night	Quality of rest	Quality of sleep	HAMD early insomnia	HAMD middle insomnia	HAMD late insomnia
Factor 1	0.19	0.11	0.20	0.19	0.22	0.17	0.18	0.18
Factor 2	0.21	0.86	0.10	-0.09	-0.01	-0.07	-0.30	-0.39
Factor 3	0.22	0.00	-0.09	-0.58	-0.32	0.73	0.37	-0.18

4.4 Social Adaptation Self-evaluation Scale

4.4.1 WEEKLY ANALYSIS OF OBSERVED CASES

Mean value of SASS total scores.

The statistical significance (p value) of the individual comparisons is indicated below.

COMPARISON	D7	D14	D21	D28	D35	D42	D49	D56
Placebo vs Fluoxetine	0.027	0.034	0.018	0.0014	0.001	0.005	0.015	0.004
Placebo vs Reboxetine	0.022	0.007	0.000	0.000	0.000	0.000	0.000	0.000
Fluoxetine vs Reboxetine	NS	NS	0.022	NS	NS	0.003	0.00015	0.001

As shown above, a statistically significant difference between active drugs and placebo is present from Day 7 on ($p < 0.034$). From Day 42 until Day 56, the difference between the average values of total SASS score in the fluoxetine and reboxetine groups is statistically significant ($p < 0.003$). Considering the total SASS score at Day 56 statistically significant differences are present as indicated below:

- Placebo vs Fluoxetine : $p = 0.001$
- Placebo vs Reboxetine : $p = 0.000$
- Fluoxetine vs Reboxetine : $p = 0.009$

4.4.2 LAST VALID OBSERVATION, ALL PATIENTS

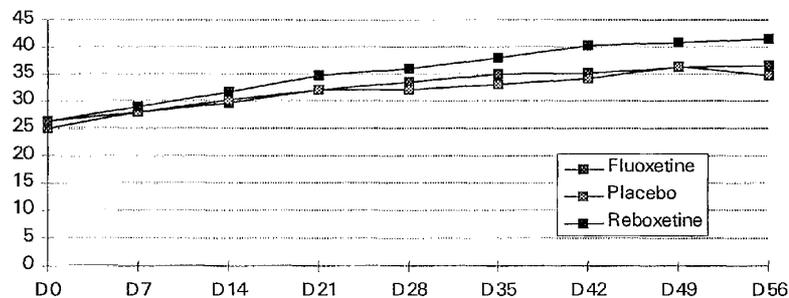

The distribution of frequencies of total SASS score at the last assessment in all patients is given by score class [4, 6, 8] and treatment in Table 6 of Appendix 3. A last valid observation score of 21 to 30 is more frequent on placebo than on active drugs. As to the comparison between the two active treatments:

- 28% of the fluoxetine-treated patients and 14% of the reboxetine-treated patients have a last assessment score between 36 and 40.
- 16% of the patients of the fluoxetine group and 35% of the reboxetine group have a last assessment score of 41 or more.

In fact the ANOVA results (see Appendix 3) indicate a significant difference between each pair of the three treatments.

4.4.3 CHARACTERISTICS OF PATIENTS IN REMISSION

SASS total score mean values, patients in remission

The statistical significance (p value) of the individual comparisons is shown below.

COMPARISON	D21	D28	D35	D42	D49	D56
Placebo vs Fluoxetine	NS	NS	NS	NS	NS	NS
Placebo vs Reboxetine	NS	0.032	0.0035	0.0019	0.011	0.0052
Fluoxetine vs Reboxetine	0.044	NS	0.026	0.0	0.0007	0.0032

Considering the sub-sample of patients eventually in remission [6], there is no significant difference between fluoxetine SASS total score and placebo at any of the assessment intervals. On the contrary, a significant difference between placebo and reboxetine remission groups is present from Day 28 on ($p \leq 0.032$), and between fluoxetine and reboxetine remission groups from Day 35 on ($p \leq 0.026$).

Comparing the remission cases with the non remission cases in the placebo group at Day 0 and Day 56, differences of the SASS total score are present as indicated below:

- in placebo-treated patients eventually in remission, there is a significant improvement at Day 56, compared to Day 0, of 9.4 points ($p = 0.0006$).
- in patients eventually not in remission the improvement at Day 56 compared to Day 0 is still statistically significant, but is smaller (4.7 points, $p = 0.000$).

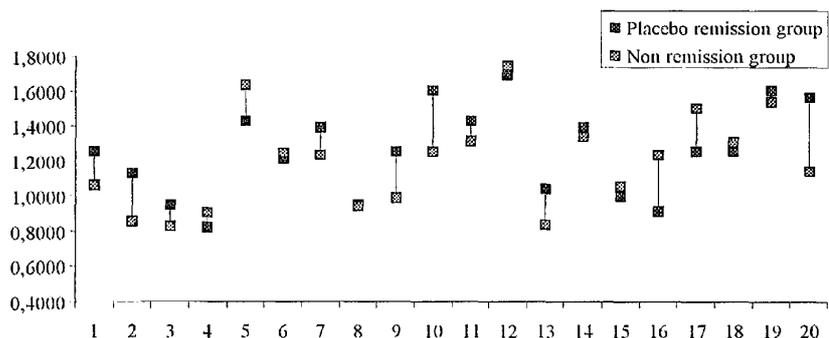

- at Day 56 the remission group is significantly different from the non remission group (5.7 points, $p = 0.012$).
- there is no statistically significant difference between the two groups at Day 0 (difference of 1 point).

In conclusion, patients eventually in remission on reboxetine were improved in their social behaviour as assessed by the total SASS score significantly more than patients eventually in remission on both placebo and fluoxetine from Day 35 on. The analysis has been therefore extended to SASS items, in order to identify those responsible for the observed difference between treatments in the total score.

4.4.4 ANALYSIS OF THE SASS ITEMS

In order to characterize in terms of modification of the different social adaptation components the population susceptible of clear-cut improvement of the clinical picture, the Day 0 mean values of the SASS items of the placebo remission group have been compared with those of all patients not in remission at the end of the study [3,7].

Remission and non remission cases in the placebo group at Day 0.

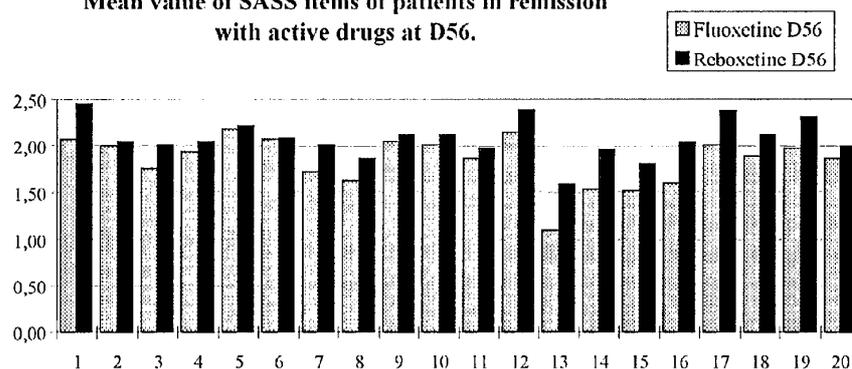

- | | |
|---|---|
| 1 : Interest in occupation or home activities | 11 : Interdependence: patient/social circle |
| 2 : Quality of activities | 12 : Compliance with social rules |
| 3 : Interest in hobbies/leisures | 13 : Quest for community activities |
| 4 : Quality of spare time | 14 : Inquiry/Learning |
| 5 : Interest in family relationships | 15 : Interest in cultural matters |
| 6 : Quality of family relationships | 16 : Difficulty in communicating |
| 7 : Quantity of extra-family relationships | 17 : Feeling of exclusion |
| 8 : Interest in extra-family relationships | 18 : Interest in personal physical appearance |
| 9 : Quality of extra-family relationships | 19 : Management of resources |
| 10 : Value attached to extra-family relationships | 20 : Organisation of environment |

A significant difference between the two groups is only present for the items "Value attached to extra-family relationships" (p = 0.009), and "Organisation of environment" (p = 0.024).

Few other items differentiate the remission from the non remission cases in the placebo group at Day 0. Compared with the non remission group profile, the remission patients on placebo have on average more interest in their home or professional activities, and a better quality of these activities. They have better extra-family relationships (quality, quantity, value attached to extra-family relationships, quest for community activities), and feel more adequate in terms of organisation of the environment. On the other hand, the interest in relationships with family members is lower than in non remission patients, the feeling of exclusion and the difficulties in communicating are higher. The other items are very similar to those of the non remission patients.

Comparing the social adaptation profile of patients in remission on fluoxetine and on reboxetine, it appears that at baseline, there is no difference between the two active drugs on any items except for "Difficulty in communicating" (about 0.5 point lower in the fluoxetine than in the reboxetine group). At Day 56, this difference is still about 0.5 point and still significant.

Mean value of SASS items of patients in remission with active drugs at D56.

- | | |
|---|---|
| 1 : Interest in occupation or home activities | 11 : Interdependence: patient/social circle |
| 2 : Quality of activities | 12 : Compliance with social rules |
| 3 : Interest in hobbies/leisures | 13 : Quest for community activities |
| 4 : Quality of spare time | 14 : Inquiry/Learning |
| 5 : Interest in family relationships | 15 : Interest in cultural matters |
| 6 : Quality of family relationships | 16 : Difficulty in communicating |
| 7 : Quantity of extra-family relationships | 17 : Feeling of exclusion |
| 8 : Interest in extra-family relationships | 18 : Interest in personal physical appearance |
| 9 : Quality of extra-family relationships | 19 : Management of resources |
| 10 : Value attached to extra-family relationships | 20 : Organisation of environment |

All items related to the quality of relationships or activities (no. 2, 4, 5, 6, 9, 10, 11, 20) are on average very similar in the two active treatment groups. For few other items (no. 3, 7, 15, 18) the reboxetine group is not significantly different from the fluoxetine group. However, the reboxetine remission group is significantly better (see Table 7) than the fluoxetine remission group at Day 56 for the following items :

- Interest in occupation or home related activities (p = 0.003).
- Quantity of extra-family relationships (p = 0.021).
- Compliance with social rules (p = 0.025).
- Quest for community activities (p = 0.006).
- Inquiry/Learning (p = 0.009).
- Feeling of exclusion (p = 0.011).
- Management of resources (p = 0.023).

In conclusion, the quality of remission in patients treated with reboxetine appeared superior to the one associated with fluoxetine treatment in terms of social adaptation as far as interest in social contacts and activities, including intellectual ones, and improvement in feeling of exclusion and resources management ability.

4.4.5 THE SASS IMPROVEMENT INDEX

The index of improvement has been calculated in each patient as follows:

(Total score at last assessment - Total score at baseline) / Total score at baseline.

The summary statistics of the improvement index (from Appendix 3) are reported below.

Treatment	N	Mean	SD	Median	25%-75%	p value <
Fluoxetine	116	0.393	0.591	20 %	0 / 0.74	0.0001
Placebo	116	0.201	0.556	9 %	-0.06 / 0.35	0.0
Reboxetine	117	0.477	0.581	23 %	0.06 / 0.93	0.0001

Both mean values and percent improvement median values are clearly different between the placebo group and the active treatment groups, the differences between the average values being statistically significant for both comparisons. While mean and median values in the reboxetine group are only slightly higher compared to the fluoxetine group (and not significantly different), the 25%-75% percentiles are different:

- in the fluoxetine group, 50 % of the patients improve more than 20 % of the baseline score during the study period, and 25 % improve more than 74 % of the baseline score.
- in the reboxetine group, 50 % of the patients improve more than 23 % of the baseline score during the study period, but 25 % improve their social behaviour more than 93 % of the baseline score.

5. DISCUSSION AND CONCLUSIONS

This study, which included 381 out-patients affected by Major Depressive Disorders, followed for eight weeks, was carried out to assess the efficacy and tolerability of reboxetine compared to placebo and fluoxetine.

The purpose of the part of the study here reported, based on a self-evaluation method, was to quantify and compare reboxetine, fluoxetine and placebo effects, as perceived by the patients, through three scales, the GIS, the Quality of Sleep Evaluation Questionnaire, and the SASS.

The statistical analysis carried out on the results of the GIS self-assessment showed a significant difference between active drugs and placebo from Day 21, and a statistically significant difference in favour of reboxetine with respect to fluoxetine at Day 56. Last assessment analysis confirmed significant differences between active drugs and placebo, but the difference between reboxetine and fluoxetine did not reach statistical significance. In the sub-population of patients eventually in remission, no difference between treatments was apparent.

As for the results of the Quality of Sleep Evaluation Questionnaire, reboxetine and fluoxetine had a similar effect on sleep duration, in both cases clearly but not significantly superior to placebo. The association of chloral hydrate resulted most effective in patients on placebo than in patients on active treatments. The association fluoxetine-chloral hydrate appeared relatively more effective than the association reboxetine-chloral hydrate, though the difference did not reach statistical significance.

The number of awakenings during the night was significantly lower in the reboxetine group than in the fluoxetine and placebo groups from Week 5 on. The between treatments difference is also significant and in favour of reboxetine as soon as at Week 4 for the quality of rest and the quality of nocturnal sleep. Comparison of the results from the Quality of Sleep Evaluation Questionnaire and HAMD sleep-related items proved difficult, and the principal component analysis suggested that the content of information of the two scales is mostly non concordant. However, also the pattern of HAMD sleep-related items confirmed the action of the active drug on sleep disorders, though the differences between treatments do not reach statistical significance.

Few papers have been published so far on the measurement of the disturbances of social adaptation, so strictly associated with the depressive illness, and particularly on patient self-assessment [11]. However, the proposed instruments are quite complex: e.g. the questionnaire proposed in [11] includes 42 questions and requires 15 to 20 minutes to complete "depending on the patient's reading ability and comprehension". The SASS has been designed to provide a simple instrument for patient self-assessment and minimise incomplete data collection in the frame of clinical trials of new antidepressant agents.

The statistical analysis carried out on the total score of the SASS after 8 weeks of treatment showed significantly greater effect of both active treatments compared to placebo in improving social behavior and the superiority of reboxetine compared to fluoxetine. These results were confirmed by the statistical analysis carried out on the last available assessment.

Pharmacia

Document 9550081

In the subpopulation of patients eventually in remission, no difference between fluoxetine and placebo groups emerged, whereas a significantly higher average total score was apparent in the reboxetine group from Day 28-35 on, indicating higher efficacy of reboxetine on the dimension of social behavior. The quality of remission in patients treated with reboxetine appeared superior to the one associated with placebo and fluoxetine treatment in terms of social adaptation as far as interest in social contacts and activities, including intellectual ones, and improvement in feeling of exclusion and resources management ability. These results, obtained in a short term treatment, should be particularly relevant for the long term maintenance therapy of the depressive disorder aimed at prevention of depressive relapses and recurrences.

3. Used scale

QUALITY OF SLEEP

(Self-evaluation Scale)

Instruction: Please answer all questions A - E by crossing out the appropriate answer.

Please check only answer for each question.

Time of falling asleep: h: min: time of waking up: h: min:

Regarding your last 1-2 nights, do you consider that:

A. After having turn off the light you have fallen asleep:

<i>Immediately</i>	<i>1</i>
<i>After 15-30 minutes</i>	<i>2</i>
<i>After one hour or more</i>	<i>3</i>
<i>Not sleep at all</i>	<i>4</i>

B. Have you been dreaming during the night?

<i>Not at all</i>	<i>1</i>
<i>A little bit</i>	<i>2</i>
<i>Moderately</i>	<i>3</i>
<i>All the night</i>	<i>4</i>

C. How many times did you awake during the night?

<i>No times</i>	<i>1</i>
<i>1-2 times for a short period of time</i>	<i>2</i>
<i>1-2 times for a long period of time</i>	<i>3</i>
<i>3 times or more</i>	<i>4</i>

D. Do you wake up in the morning:

<i>Fully rested and fresh</i>	<i>1</i>
<i>Quite rested</i>	<i>2</i>
<i>A little bit tired</i>	<i>3</i>
<i>Tired and fatigued</i>	<i>4</i>

E. Generally, do you think that your sleep was:

<i>Very good</i>	<i>1</i>
<i>Good</i>	<i>2</i>
<i>Fair</i>	<i>3</i>
<i>Poor</i>	<i>4</i>

Sleep medication (name) dose (mg) taken: YES NO

42 (209)

Pharmacia

Document 9550081

3. Used scale (continued)

HAMD SLEEP-RELATED ITEMS

4. Insomnia early

- 0 No difficulty falling asleep.
 - 1 Complains of occasional difficulty falling asleep - i.e., more than 1/2 hour.
 - 2 Complains of nightly difficulty falling asleep.
-

5. Insomnia middle

- 0 No difficulty.
 - 1 Patient complains of being restless and disturbed during the night.
 - 2 Waking during the night - any getting out of bed rates 2 (except for purposes of voiding).
-

6. Insomnia late

- 0 No difficulty.
 - 1 Waking in early hours of the morning but goes back to sleep.
 - 2 Unable to fall asleep again if he gets out of bed.
-

APPENDIX 3

1. Social Adaptation Self-evaluation Scale

Table 6
SASS total score at last valid observation:
frequency distribution by score class.

Classes	Fluoxetine (%)	Placebo (%)	Reboxetine (%)	Total
≤ 20	16 (13)	27 (23)	8 (7)	51
20 < . ≤ 25	16 (13)	25 (22)	16 (14)	57
25 < . ≤ 30	14 (12)	23 (20)	15 (13)	52
30 < . ≤ 35	19 (16)	13 (11)	21 (18)	53
35 < . ≤ 40	32 (28)	16 (13)	16 (14)	64
40 < . ≤ 45	9 (8)	7 (6)	21 (18)	37
> 45	10 (8)	5 (4)	20 (17)	35
Total	116	116	117	349

ANOVA : R-Square = 0.086

F test = 0.0001

Multiple comparison tests (same results with LSD and Bonferroni)

Reboxetine N=117 Mean=35.2

Fluoxetine N=116 Mean=32.3

Placebo N=116 Mean=27.7

The 3 groups are significantly different between each other with a 5% risk

Pharmacia

Document 9550081

**SASS index of improvement by treatment:
Student t test.**

	F vs P	R vs P	F vs R
Difference between mean values	0.192	0.275	0.08
p value	0.0054	0.000	NS

ANOVA : R-Square = 0.039

F test = 0.001

Multiple comparison tests (same results with LSD and Bonferroni)

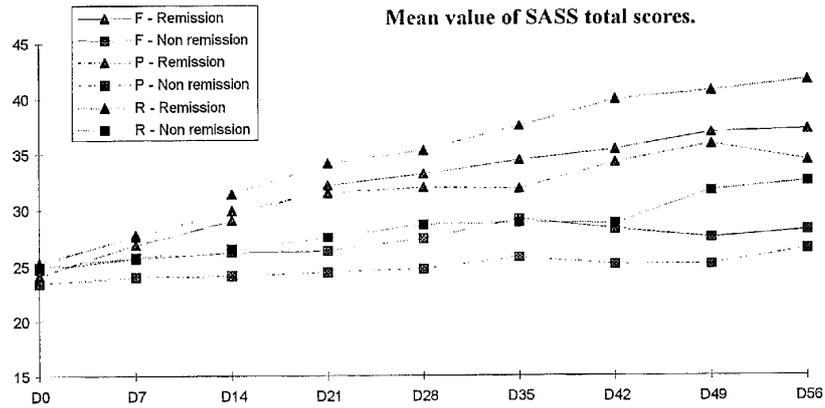

Reboxetine N=117 Mean=0.48

Fluoxetine N=116 Mean=0.39

Placebo N=116 Mean=0.20

The active drug groups are significantly different from the placebo group with a 0.05 α level, but they are not different between each other.

SASS total score mean values - remission and non remission cases.

Document 9550081

2. Used scale

**SOCIAL ADAPTATION SELF-EVALUATION SCALE
(SASS)**

You are asked to answer some simple questions, stating what your opinion is at this moment. Please answer all questions and circle one answer for each question. Thank you.

- 1/ **Do you have an occupation? YES NO**
- If "yes":
- A. Are you interested in your occupation? YES NO
- if "no":
- B. How interested are you in your home-related activities?
- 3- very 2- moderately
 1- a little 0- not at all
- 2/ **Do you pursue this occupation/these activities with:**
- 3- a lot of enjoyment? 2- some enjoyment?
 1- only a little enjoyment? 0- no enjoyment at all?
- 3/ **How interested are you in hobbies/leisure?**
- 3- very 2- moderately
 1- a little 0- not at all
- 4/ **Is the quality of your spare time:**
- 3- very good? 2- good?
 1- fair? 0- unsatisfactory?
- 5/ **How frequently do you seek contact with members of your family (spouse, children, parents, etc.)?**
- 3- very frequently 2- frequently
 1- rarely 0- never
- 6/ **Is the state of relations in your family:**
- 3- very good? 2- good ?
 1- fair? 0- unsatisfactory?

- 7/ **Outside of your family, do you have relationships with:**
- | | |
|-----------------------|-----------------|
| 3- many people? | 2- some people? |
| 1- only a few people? | 0- nobody? |
- 8/ **Do you try to form relationships with others:**
- | | |
|-------------------------|----------------------|
| 3- very actively? | 2- actively? |
| 1- moderately activity? | 0- in no active way? |
- 9/ **How - in general - do you rate your relationships with other people?**
- | | |
|--------------|-------------------|
| 3- very good | 2- good |
| 1- fair | 0- unsatisfactory |
- 10/ **What value to you attach to your relationships with others?**
- | | |
|------------------------|--------------------|
| 3- great value | 2- some value |
| 1- only a little value | 0- no value at all |
- 11/ **How often do people in your social circle seek contact with you?**
- | | |
|---------------|----------|
| 3- very often | 2- often |
| 1- rarely | 0- never |
- 12/ **Do you observe social rules, good manners, politeness, etc.?**
- | | |
|-----------|---------------------|
| 3- always | 2- most of the time |
| 1- rarely | 0- never |
- 13/ **To what extent are you involved in community life (clubs, church, etc.)?**
- | | |
|-------------|---------------|
| 3- fully | 2- moderately |
| 1- slightly | 0- not at all |
- 14/ **Do you like searching for information about things situations, and people to improve your understanding of them?**
- | | |
|--------------|---------------|
| 3- very much | 2- moderately |
| 1- not much | 0- not at all |
- 15/ **Are you interested in scientific, technical, or cultural information?**
- | | |
|------------------|---------------|
| 3- very | 2- moderately |
| 1- only slightly | 0- not at all |
- 16/ **How often do you find it difficult to express your opinions to people?**
- | | |
|--------------|----------|
| 0- always | 1- often |
| 2- sometimes | 3- never |

Pharmacia

Document 9550081

17/ How often do you feel rejected, excluded from your circle?

0- always
2- sometimes

1- often
3- never

18/ How important do you consider your physical appearance to be?

3- very
1 not very much

2- moderately
0- not at all

19/ To what extent do you have difficulties in managing your resources and income?

0- always
2- sometimes

1- often
3 - never

20/ Do you feel able to organise your environment according to your wishes and needs?

3- very much so
1- not very

2- moderately
0- not at all

That's all. Thank you for answering the questions.

For official use : Total score =
